iStore Commercial

This is the home screen of iStore Commercial. The appropriate store official can input and initialize their Store ID, their Store Address, and Store Zip code so as to populate the external database.

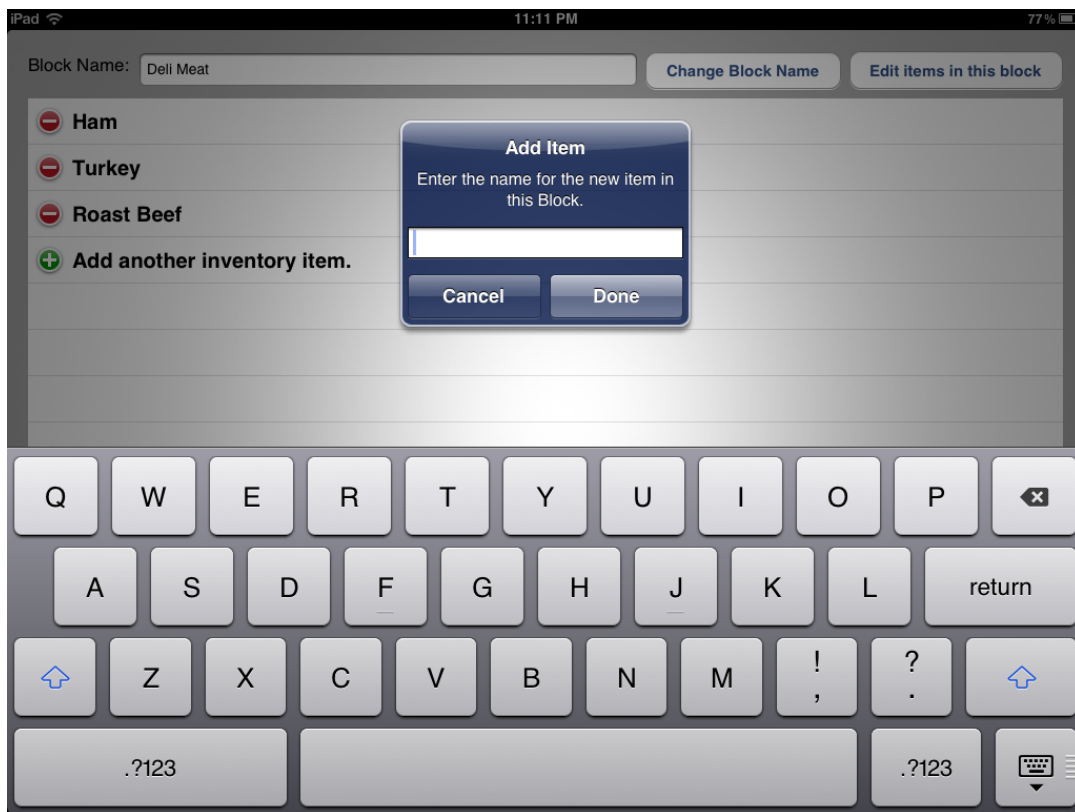

iStore Commercial

The user can edit the store map by tapping the appropriate button, which includes adding new blocks of variable sizes to their store map.

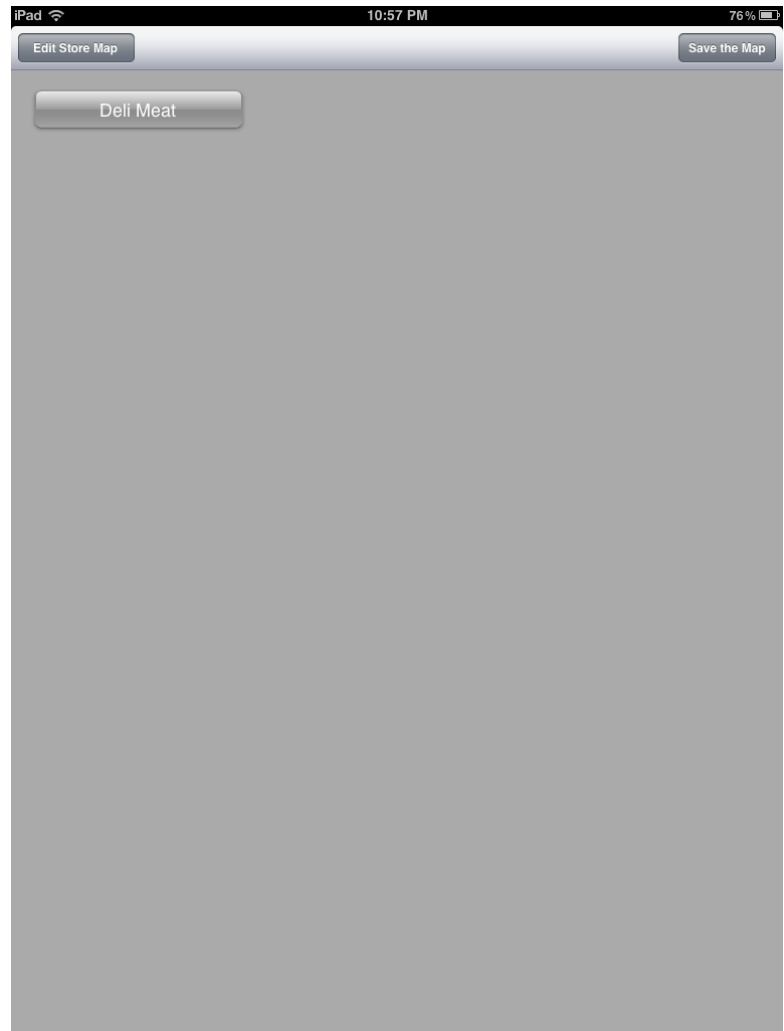

iStore Commercial

By tapping the block, the user is able to add to or take away from the inventory represented in that block, as well as change the name of the block. The display auto rotates to landscape mode for easier typing.

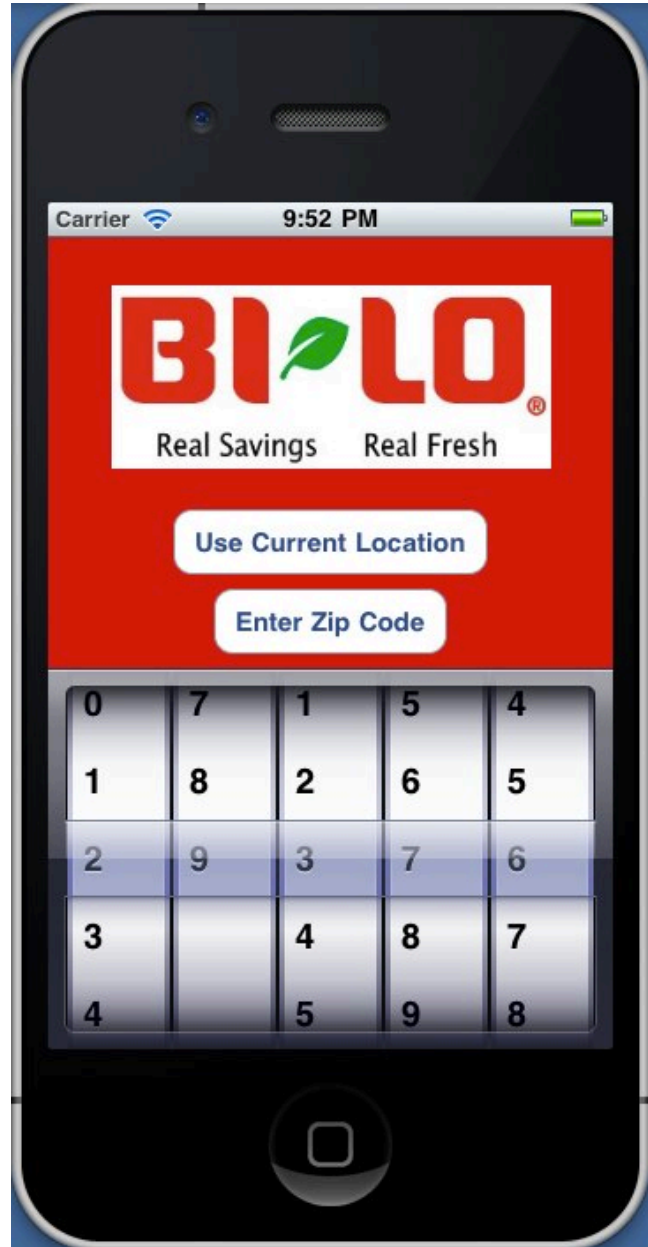

iStore Commercial

The user can then export the created store map and save it to their database by tapping the appropriate button.

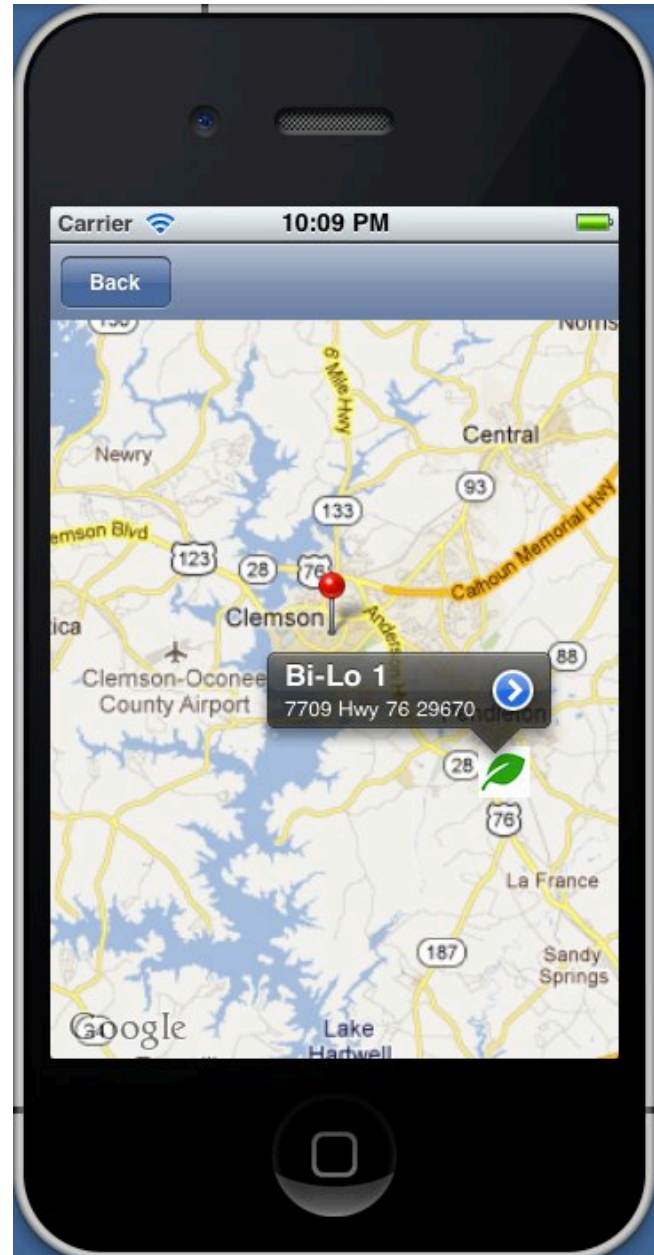

Client iStore – Home

This is an example of a home screen for a potential Client iStore app. Each Client iStore will vary in looks and feel based on the company that it represents. However, the functionality will remain the same throughout. On this home screen, the user is able to locate the store nearest to them using either GPS, or by inputting their Zip Code. This will then take them to a map view displaying the stores nearest their input location.

Client iStore – Store Locator

This screen displays the closest stores in the area of the user's input location. The stores within the area will be labeled with icons. Once the appropriate icon

Client iStore – Store Map

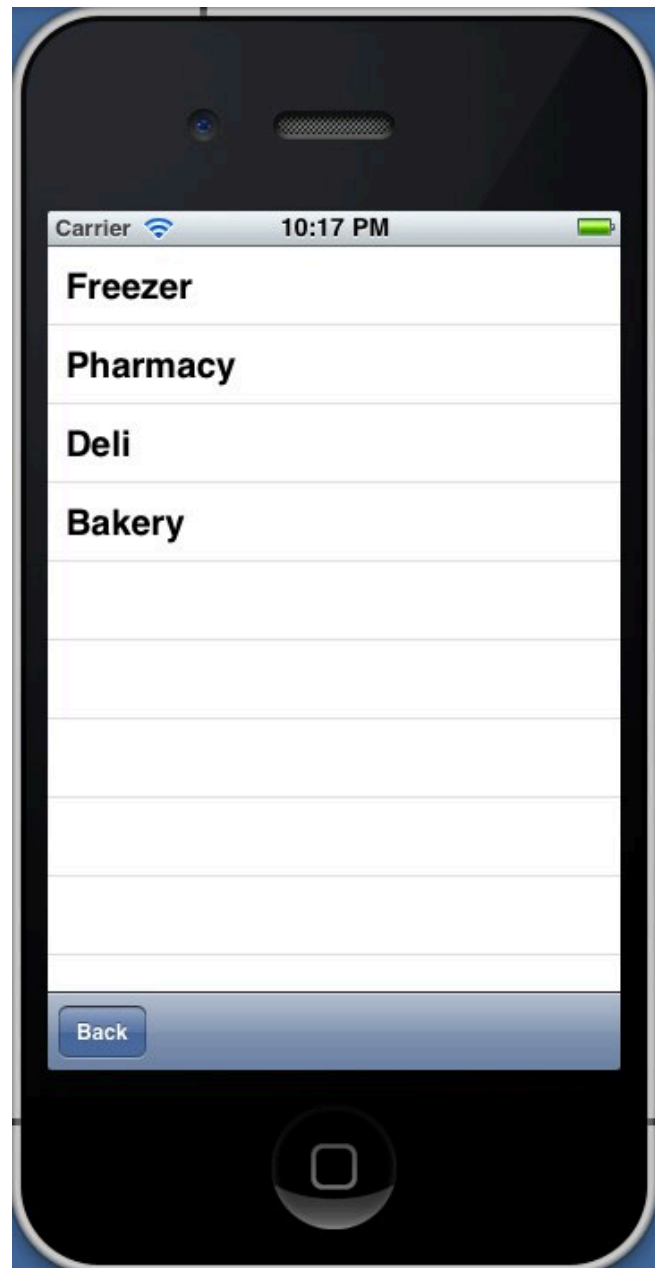

This screen displays to the user the map of the store that they have selected. This map is designed by the store's iStore Commercial operator and should correspond to the current layout of the store.

The user may then click on the Products button to view a searchable table that lists all of the products, which have been input by the iStore Commercial operator.

Client iStore – Product Categories

This screen allows the user to search through a list of the products available in the store by tapping on the corresponding category. This list corresponds to the Product Category blocks as seen on the Store Map. The user can then tap on a Product Category and see the different items available in that category.

Client iStore – Product Located

After the user finds the product they want by looking through the categories, and then the items in that category, the map will reappear with the category containing the selected product highlighted.
